Article

Adding additional simulators

Add simulators for different devices and iOS versions to use for web development.

Overview

A Simulator runtime is an OS package that Simulator loads when booting a device, which is specific to a particular OS and version. Simulator runtimes are then used by numerous different Simulators with different device types, like iPhone 14 or iPad Pro.

If you want to test on another platform or OS version, you need to add the Simulator runtime for that platform, and then create a new Simulator.

Install and uninstall Simulator runtimes

Adding a Simulator runtime

1. In Xcode, from the menu bar, choose **Xcode > Settings....**
2. Go to the **Platforms** tab.
3. Click the Add button (+) in the lower left corner, and then select a platform to view a list of its available versions.
4. Select a version and click **Download & Install**.

Removing a Simulator runtime

To recover storage space from unused Simulator runtimes:

1. In Xcode, from the menu bar, choose **Xcode > Settings....**
2. Go to the **Platforms** tab.
3. Select the Simulator runtime you wish to remove.
4. Click the Delete button (–) in the lower left corner.
5. Click **Delete** in the confirmation dialog.

Add and remove Simulators

Adding a Simulator

1. In Xcode, from the menu bar, choose **Window > Devices and Simulators**.
2. Choose **Simulators** at the top of the sidebar.
3. Click the Add button (+) in the lower left corner.
4. Choose a **Device Type** and **OS Version** for your simulator, and optionally provide it with a name.
5. Click **Create** to create the new simulator.

Removing a Simulator

1. In Xcode, from the menu bar, choose **Window > Devices and Simulators**.
2. Choose **Simulators** at the top of the sidebar.
3. Control-click on the Simulator you wish to remove.
4. Choose **Delete** from the pop-up menu.
5. Click **Delete** in the confirmation dialog.

Tip

Simulators can also be [managed from the terminal](#).
