

.NET MAUI Tutorial - Build your first multi-platform app in C#

Windows

macOS

Introduction

Download and install

Create your app

Run your app

Edit your code

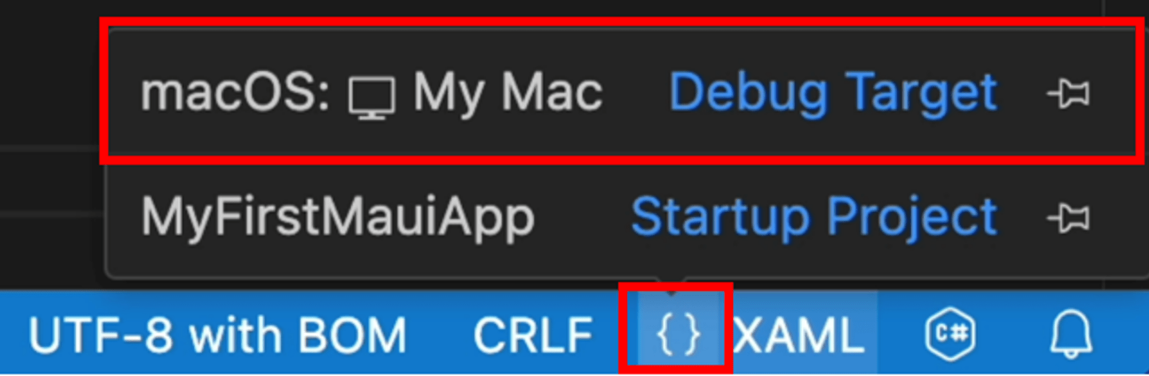

Run on mobile device

Next steps

Run your app

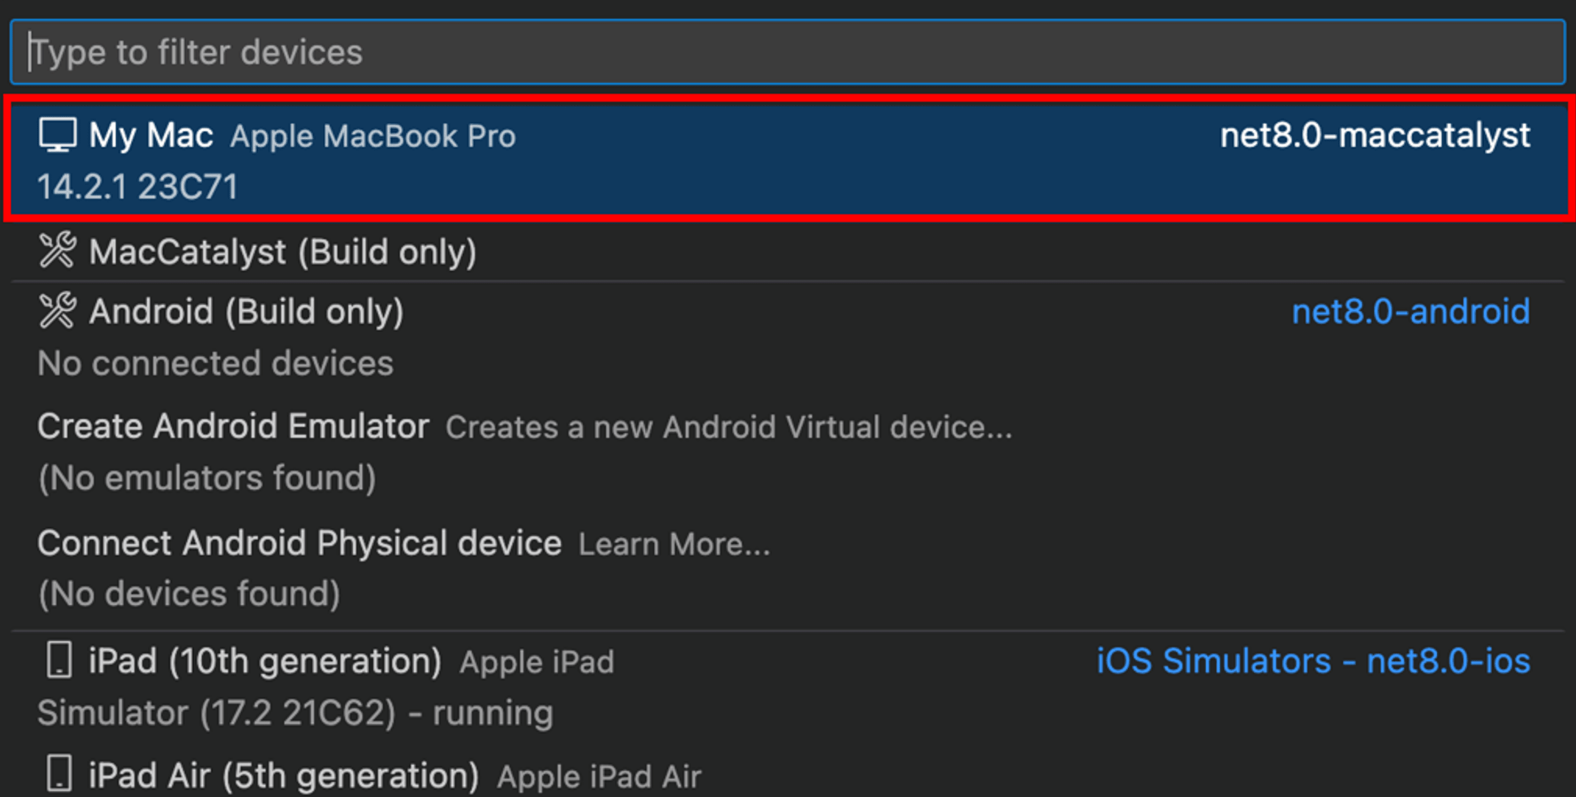

This tutorial will focus on deploying a .NET MAUI application to your local Mac machine first. Later, you'll have the option to run on an iOS simulator.

In the bottom right of the VS Code window, you should see **curly braces** in the Status Bar. Click on the curly braces, and you should see **My Mac** selected as the default debug target.

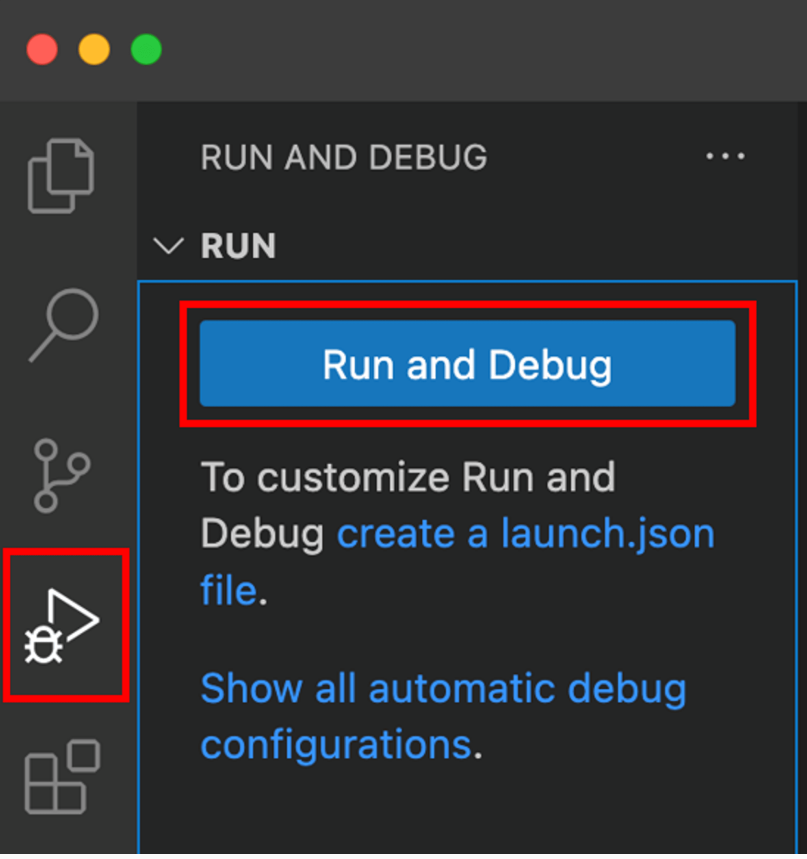

If you don't see the curly braces in the Status Bar, make sure to have a relevant project file open like a .cs, .xaml, or .csproj file that belongs to the .NET MAUI project. Alternatively, you can open the command palette in VS Code by pressing **CMD** + **SHIFT** + **P**. And then type **.NET MAUI: Pick**. That will show you the options to pick a debug platform for your project.

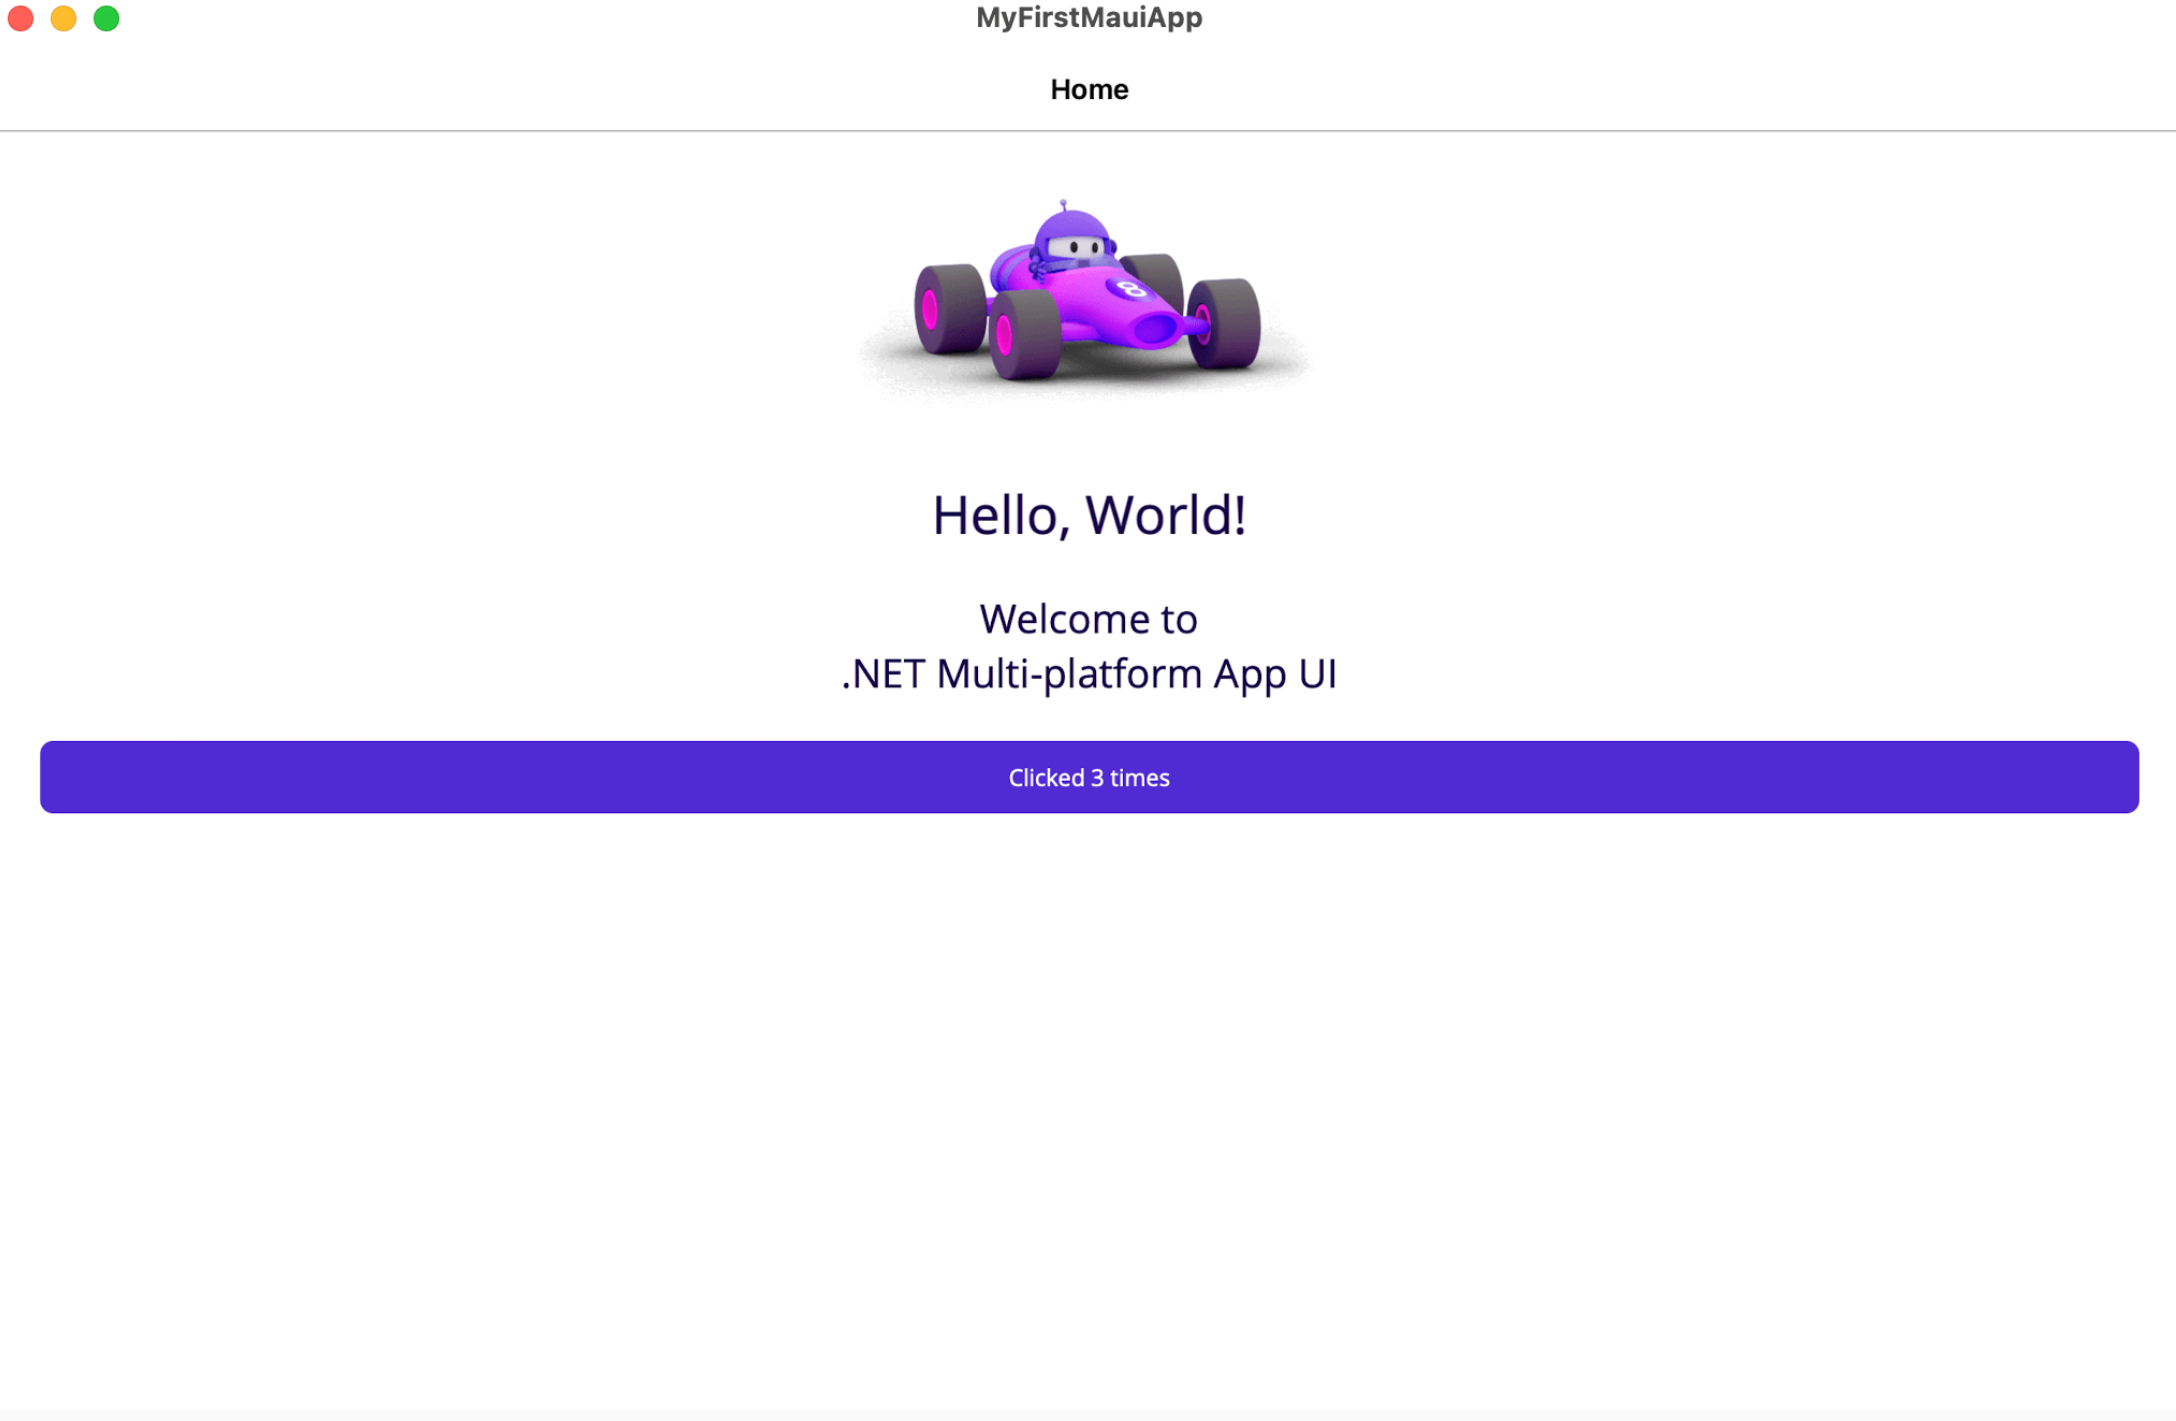

If you don't see anything selected, click on **Debug Target** and select **My Mac** from the list. Please note, it may not be the first item in your list upon the first time selecting a debug target.

To run the app, click the **Run and Debug** icon in the VS Code Activity Bar. Then click **Run and Debug**.

In the running app, select the **Click me** button a few times and observe that the count of the number of button clicks is incremented:

Congratulations, you've built and run your first .NET MAUI app! Keep the app running and continue the tutorial.
