Search by name... 🔍

Class names should comply with a naming convention		Code Smell
Track uses of "TODO" tags		Code Smell
Deprecated code should be removed		Code Smell
Cyclomatic Complexity of functions should not be too high		Code Smell
Constant names should comply with a naming convention		Code Smell
Unnecessary nullable in final declaration should be removed		Code Smell
Dependencies should be sorted		Code Smell
Unused assignments should be removed		Code Smell
Standard outputs should not be used directly to log anything		Code Smell
Variables should not be initialized with "null"		Code Smell
Files should end with a newline		Code Smell

Constant names should comply with a naming convention

Analyze your code

Consistency - Identifiable Maintainability 
 Code Smell  Critical   convention

Why is this an issue? How can I fix it? More Info

Constants are variables whose value does not change during the runtime of a program after initialization. Oftentimes, constants are used in multiple locations across different subroutines.

It is important that the names of constants follow a consistent and easily recognizable pattern. This way, readers immediately understand that the referenced value does not change, which simplifies debugging.

In Dart, the convention is that constant identifier names should be in camel case and start with a lowercase.

What is the potential impact?

Ignoring the naming convention for constants makes the code less readable since constants and variables are harder to tell apart. Code that is hard to understand is also difficult to maintain between different team members.
