Extension identifiers should comply with a naming convention

Local identifiers should not start with underscore

If-null operator should be preferred

Null-aware operators should be preferred

Generic function type aliases should be preferred

Type parameters should not shadow other type parameters

"static final" declarations should be "const" instead

Interpolation should be used instead of String concatenation

Collection literals should be preferred

Conditional assignment should be preferred

"this" should only be used when required

Exceptions should not be ignored

Extension identifiers should comply with a naming convention

 Code Smell

 Minor 

 convention

Extension identifier, when present, should be in PascalCase.

Why is this an issue?

How can I fix it?

More Info

Extensions are a way to add functionality to existing classes. As such, they contain methods, getters, and setters, in the same way classes do.

Therefore, it makes sense to adopt the same naming convention as for classes, which is **PascalCase** (a.k.a. UpperCamelCase).

This makes the code more homogeneous and doesn't mislead developers into thinking that the extension is a variable or a function.
