# Dart static code analysis

Unique rules to write Clean DART Code

All rules **115**

 Bug **15**

 Code Smell **100**

|                                                                  |                                                                                     |            |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------|------------|
| Unnecessary string interpolations                                |    | Code Smell |
| "late" modifier should be necessary                              |    | Code Smell |
| Unnamed constructor should be used instead of `.new`             |    | Code Smell |
| Initialization formals shouldn't be unnecessarily type annotated |  | Code Smell |
| Triple slash should be used for documentation comments           |  | Code Smell |
| Adjacent string concatenation should be preferred                |  | Code Smell |
| Non-constant names should comply with a naming convention        |  | Code Smell |
| Void functions should not return null                            |  | Code Smell |
| Function declarations should be preferred over variables         |  | Code Smell |
| Extension identifiers should comply with a naming convention     |  | Code Smell |
| Local identifiers should not start with underscore               |  | Code Smell |
|                                                                  |                                                                                     |            |

## Unnecessary string interpolations

Analyze your code

Intentionality - Clear

Maintainability ▾

 Code Smell  Minor ⓘ

String interpolation should be used only when there is a mix of variables and string in the same expression.

Why is this an issue?

How can I fix it?

More Info

String interpolation is a powerful feature in Dart that allows you to embed expressions within string literals.

```
final expression = 'expressions';
print('a string mixing ${"literals"} and ${2 + 1} ${expressions}');
// Prints 'a string mixing literals and 3 expressions'
```

However, using string interpolation where it is not needed can make the code harder to read and maintain.

```
final aString = 'a string';
print('$aString'); // Unnecessary string interpolation
```

It is recommended to use string interpolation only when there is a mix of variables and strings in the same expression.
